“The value of salivary biomarkers for systemic disease is one of the final frontiers”

**Interview with Dr David Wong, USA**

In the past six years, saliva has risen to centre stage for disease detection, monitoring and even health surveillance. Den
tal Tribune Asia Pacific in cooperation with FDI Worldden
tal Daily spoke with UCLA’s Dr David Wong at this year’s World Dental Congress in Sin
gapore about salivary diagnostic
toolboxes and how they could be utilised for detecting systematic diseases.

**WDD:** In recent years, the role of saliva for the detection and monitoring of diseases has risen to centre stage. Can you summarise the latest find
ings for us?

**Dr David Wong:** Seven years ago, the National Institute of Dental and Craniofacial Research (NIDCR), one of the 27 institutes at the US National Institute of Health (NIH), made a visionary investment to turn salivary diagnostics into a clini
cal reality. The outcomes of this scientific investment are what constitute the recent excite
ment and clinical potential for salivary diagnostics. We now know there are multiple diag
nostic alphabets in saliva to de
fine the diagnostic coordinates of oral and systemic diseases. Point-of-care diagnostic tech
nologies are soon to be in place to permit a drop of saliva to detect and monitor diseases at the dental practice.

**How exactly does saliva work as a biomarker?**

Biomarkers are defined as cellular, biochemical, and mol
ecular characteristics by which normal and/or abnormal pro
cesses can be recognised and/or monitored. The salivary glands (major and minor) secrete ap
proximately 1.5 litres of saliva into the oral cavity daily, carrying (major and minor) secrete ap
proximately 1.5 litres of saliva into the oral cavity daily, carrying

**The sources of these biomarkers can be disease sites or the sali
vary glands themselves can pro
duce disease informative surro
gate biomarkers. The salivary
 gland system can be viewed as a
 local anatomical organ that is
 posed to monitor local and sys
 temic diseases. The good news is
 that the biofluid secreted (saliva)
 can be obtained non-invasively,
 painlessly and without embar
 rassment to the patient—no nee
 dles and no neping.

**Which salivary diagnostic
toolboxes are at hand or cur
rently in development and how
could these be incorpo
rated into the clinical practice?**

Current salivary diagnostic
toolboxes include the diag
nostic alphabets (proteome, transcriptome, micro-RNA and micro
bial) and point-of-care diagnos
tic technologies. Integration into clinical practice requires identification of effective clini
cal application and approval by the Federal Drug Administra
tion in the US.

**With the exception of the
salivary HIV antibody test, no other salivary biomarker test has reached the FDA-level eval
uation. We anticipate that our point-of-care devic and biomark
ers for oral cancer dete
ction will be evaluated by the FDA in the next two years.**

**Do oral diseases have any impact on the diagnostic value of saliva?**

A number of oral diseases have been evaluated for salivary diagnostic applications, includ
...
Visitors were spoilt by this year’s scientific programme, which not only featured popular topical topics like aesthetics, periodontics, but also gave insight into new challenges and developments in dentistry. Among others, the prevalence of oral cancer, salivary bio-markers, and the therapeutic potential of dental stem cells and tissue engineering were discussed. Limited attendee courses were extended to guide participants in the choice to learn in a more intensive and intimate environment. Auxiliaries and office personnel had the chance to get their hands on the New Patent Experience in a special full-day programme. As one participant put it: “What strikes me about this congress is how it brings together so many different specialist areas in dentistry, all under the same roof.”

Although official numbers have not yet been released, exhibitors speaking to Dental Tribune Asia Pacific said that visitors’ numbers did not meet their expectations. In spite of this, most exhibitors reported increased numbers in sales and business deals. Plenty of new products and processes were introduced, for example surgical instruments and handpieces that now come with built-in and long-lasting LED lights. Nobel Biocare introduced their newest product NobelProcera to Singaporean dentists at an official launch dinner held at the Carlton Hotel. The system aims to combine industrialised production processes with versatile and individualised aesthetics for dental restorations.

In addition, continuing education was offered to trade show visitors through Dental Tribune in collaboration with the DT Study Club, who held their first online symposium outside the US.

Members of the 2010 Local Organising Committee invited participants in next year’s congress in Salvador da Bahia in Brazil, home country of the newly appointed FDI President Dr Roberto Vianna. Dr Vianna, who took over the presidency from Dr Burton Conrad from Canada, received his DDS from the Federal University of Rio de Janeiro in 1985. Since then, he has served in many national and international health organisations, including the World Health Organization and the Latin America Association of Dental Schools.

“I am very happy to lead the FDI as president over the next two years. The organisation is, of course, the voice of dentistry, but more so, it is a means of empowering dentists to think about oral health on another level, for the benefit of the greater population,” Dr Vianna said. “I would like to contribute and help spread the FDI message; to accomplish the objectives expressed in our mission. The FDI is a strong organisation that continues to improve.”

“I’d like to see us focus on developing our relationships and networks, both across the organisation and outside. I am very happy with the direction we are moving in. Since I became part of the Executive Committee there have been a lot of positive changes—new staff members, the relocation of head office, our Executive Director—and important projects, like the Global Caries Initiative (GCI),” he added.

The GCI is a collaborative project led by the FDI with the long-term goal of eradicating dental caries. In July 2009, the Rio Caries Conference was held in Brazil to launch the initiative, and a series of follow-up events are expected over the next ten years. Dr Vianna announced that he would support the GCI throughout his term as president.

Another important advocacy tool during his term will be the new Oral Health Atlas, which was launched at the FDI Pavilion in Singapore and will be available on Amazon UK after the FDI congress. According to Dr Vianna, this will be a landmark publication that will strengthen the FDI’s position as a world leader for the promotion of oral-health information by demonstrating the state of world oral health straight-forward language for everybody—from dentists to government delegates to the general public.

Speaking about the 2010 FDI Annual World Dental Congress in his home country Brazil, Dr Vianna borrowed a phrase from France’s national anthem “Le jour de gloire est arrivé” (The day of glory has arrived): “I am very excited to see the AWDC come back to South America, for only the third time in the FDI’s history. There has been a lot of breakthrough research and development in Brazil in recent years. Hosting the annual congress will further strengthen oral-health promotion across the region.”

“e.max LITHIUM DISILICATE IS THE MOST ROBUST CERAMIC SYSTEM TESTED TO DATE.”

This changes everything.

The durability of lithium disilicate glass-ceramic crowns is higher than that of veneered zirconium oxide. Lithium disilicate is therefore the material of choice for single crowns: strong, aesthetic, economical. Try it yourself.
