Short-term gains...long-term problems?

The emergence of STO and its future implications in general practice. By Aws Alani, UK.

The provision of orthodontics can be a life-changing experience for young patients whose “crooked” teeth can affect their confidence and self-esteem. Indeed, where mature patients present with a history of malalignment, it equally beneficial and fulfilling results can be achieved. In government-funded systems, patients with congenital abnormalities receive treatment that is essential to their ongoing oral health. Restorative dentists work closely with orthodontists, who appreciate how small details can add in achieving positive restorative outcomes.

As a young dentist, I corrected a tooth in cohabitee with a simple T-spring appliance. It was enjoyable and brought a different type of delayed gradual satisfaction to the more cerebral but bounteous molar endodontics or the more artistic and integral composite build-up. I was not a specialist, but I managed to do some orthodontics. In contrast to my experience, general dental practitioners are now more routinely providing teeth movement with the emergence of short-term orthodontics (STO). This has resulted in some conjecture as to the methods of achieving “straighter” teeth. Indeed, some may consider STO as an emerging entry competing with specialist orthodontists, but should it be?

The specialist training pathway for orthodontics involves a competitive-entry three-year full-time course linked with the achievement of a master’s level qualification that many may feel daunting to do. Indeed, some patients request orthodontic treatment. In response to this trend and to update dentists on the most significant developments in the field, Dental Tribune International (DTI) has added ortho—international magazine of orthodontics to its portfolio. The 2016 issue includes articles on clear aligners, vibration therapy and rapid maxillary expansion, as well as the latest product information and event previews.

The new high-gloss English language magazine adopts an interdisciplinary approach involving orthodontics, oral surgery, periodontics and restorative dentistry, and aims to serve as an educational tool, providing comprehensive knowledge and information on the newest techniques that can benefitfully be integrated into treatment concepts. The publication, which will be distributed at all major international orthodontic congresses and exhibitions, presents the latest research and case studies, as well as trends in procedures and techniques.

In order to connect with orthodontic specialists, the DTI team is scheduled to attend a number of orthodontic events around the globe in 2016, including the 29th Congress of the European Orthodontic Society, which will take place between 11 and 16 June in Stockholm in Sweden, and the fourth Scientific Congress for Aligner Orthodontics, to be held on 18 and 19 November in Cologne in Germany. DTI will be providing comprehensive live coverage of these and other events on its website. In addition, e-newsletters about the respective events will be sent to orthodontists worldwide.

From 2017, a new issue of the ortho magazine will be published twice a year with a print run of 4,000 copies. An e-paper edition of the magazine is available free of charge via the DTI online print archive.
Regulate promotion and advertising ethically with factual, easily understood information from a source that is independent of practitioners and promoters. This is unfortunately not always readily available. In some Australian jurisdictions, there are specific guidelines that need to be adhered to for promotion of cosmetic treatments and they specifically cover before and after treatment adverts, which we know in the UK is a popular practice among the cosmetically driven. This is commonly one ideal, perfect case showcased on the front end of the practice website with no mention of any problems, either acute or chronic. Another aspect of the report detailed prohibition of time-limited offers or inducing potential customers through free consultations for the purposes of treatment uptake. The latter is something that has seen STO promoted by way of voucher deals on the Internet or via smartphone applications. Others may consider such a practice as loss leading; one could ask who is losing and who is gaining and at what price?

One important aspect of the report identified the wider social impact of cosmetic procedures in that people may become increasingly dissatisfied with themselves and their appearance, culminating in deeper concerns for the person and reducing scope for individuality. Many dentists throughout the country may have a slipped contact here, a rotation there or a space distal to a canine who are unlikely to be waiting in earnest for the next voucher deal alert on their iPhones. Inducing misgivings or raising concerns about the patient’s tooth position where the teeth are otherwise healthy and the patient presents with no concerns could be considered unethical and worryingly dishonourable.

Relapse of confidence

In a recent publication from an indemnity provider, orthodontics was identified as an emerging area for claims against their clients. This is likely to be the tip of the iceberg, whose size will probably continually grow as more and more orthodontics is provided and the repercussions of which may only become apparent gradually in the future.

In the now highly litigious arena of UK dentistry, the failure of orthodontic treatment against the backdrop of Montgomery v. Lanarkshire Health Board is likely to result in increased litigation. The movement of teeth into what the patient and the dentist feel is the correct position may be possible in the short term, but in the long term complications may arise owing to a variety of soft- and hard-tissue factors that cannot accommodate this new and supposedly “right” position. Indeed, orthodontics requires the appreciation of detail where symmetry and alignment are “king”, but long-term stability is the likely “empress”. Relapse of position is a common complaint and where patients have paid handsomely for a result they may have been happy with at the time of the cheque clearing, over time tiny tooth shuffles can result in disproportionate and vehement dissatisfaction. Where teeth are moved indiscriminately, recession in the labial segment is a complication difficult to explain and remedy in the high lip line of a conscientious and ambitious corporate female patient. Indeed, more haste, less speed may result in a case being etched longer in the memory of the patient and the clinician for the wrong reasons.

Clear steps to business building

A cornerstone of a successful business is the repeat customer who values the dentist and his or her service and returns with no qualms or misgivings about what the dentist feels should be provided. A successful business relies on patients returning in the long term owing to their positive experiences. Focusing on short-term gains without due consideration of quality or reliability of the treatment provided has potential repercussions for patients, the business of dentistry and perception of the profession.

Individuals play the game, but teams win championships

What it takes to build the ultimate practice unit

By Lina Craven, UK

It is said that all teams are groups, but not all groups are teams. What separates the two is interdependence. A true team is focused on a common purpose; team members support one another and enhance each other’s work and contribution. Andrew Carnegie captured this accurately when he said, “Teamwork is the ability to work together toward a common vision. It is the fuel that allows common people to attain uncommon results.”

I know that achieving the ultimate team is possible, because when I was a dental nurse many years ago in America, I was part of an ultimate team. What made us great was our leader, Dr Derrick Tagawa. He and his partner had a very clear vision and they knew exactly what was needed from each one of us to ensure the practice achieved its desired results. In turn, each one of us knew that every challenge we faced was an opportunity for personal, professional and practice growth.

Practices with a motivated, focused and empowered team produce excellent results; consequently, patient satisfaction is high and practitioners realise increased financial rewards. Achieving such a team is not pie in the sky but it does require complete commitment from the whole team. Based on my own experience of being a part of a high-performing team and my observations as a consultant to practices, here are my key principles for the creation of an ultimate team.

Do not confuse being the boss with being a leader. Leaders set the tone for the practice. They lead by positive example. Successful teamwork starts at the top with leaders who provide strategic vision and establish team goals. Effective leaders clearly define their vision and share it with their team to establish a common purpose.

Any successful relationship can only survive if values are shared, believed and agreed upon, values like honesty, respect, integrity and commitment to each other, commitment to the practice success. Shared values help to build an effective team and to establish its culture, conduct, rules and policies. The key is to ensure the entire team agrees on the same values and is prepared to work by them. According to the world’s finest flight demonstration team (the Blue Angels, US Navy), “without shared values, peak performance isn’t possible,” and “a team’s values must align with its purpose, mission, and actions.”

Every team member, from the leader to the cleaner, must learn to communicate clearly and effectively. Successful relationships are built on positive, honest and open feedback. Is information shared openly and honestly in your team? Does gossip or negative chatter exist in your practice? Team members must learn to address concerns, deal with conflict and accept responsibility for the success of other team members.

When conflict occurs, it must be dealt with honestly, directly and openly as soon as possible and in line with the team’s adopted values. Foster positive attitudes and creative thinking—attitudes can either make or break the team’s dynamics, so there is no place for negative people.

Do all your team members have clear and up-to-date job descriptions? Are they all qualified to undertake their roles? Are there written procedures for every area of the practice? Often, heatteam members say they are not sure who is responsible for something, or they do not have a job description, or they were promised training when they started, but have not yet received any owing to the practice being too busy. Empowerment results from clearly defined roles and procedures and a shared understanding of one another’s role. Cross-training increases efficiency and thus become bored or complacent. Dr Tagawa believed in providing the best training for his staff. He also recognised that he may lose some individuals who desired greater career progression than the practice could offer. He knew nevertheless that those who remained were more likely to be peak and more than justify his investment.

Every morning in Dr Tagawa’s practice as part of our commitment to the team, we would meet 10 minutes prior to the start of the day to prepare for the show. The head receptionist had a simple but effective system for updating us with vital information, including how many patients we would be seeing, special recognitions (like patients’ birthdays), identifying difficult patients, where staff were expected to be (from the rota) and anyone off that day. It only took 5 minutes for the update and 5 minutes more to review the day before regarding what had worked well and what had not. It helped us to focus on the day ahead.

Do not confuse being the boss with being a leader. Leaders set the tone for the practice. They lead by positive example. Successful teamwork starts at the top with leaders who provide strategic vision and establish team goals. Effective leaders clearly define their vision and share it with their team to establish a common purpose.

Any successful relationship can only survive if values are shared, believed and agreed upon, values like honesty, respect, integrity and commitment to each other, commitment to the practice success. Dr Tagawa believed in providing the best training for his staff. He also recognised that he may lose some individuals who desired greater career progression than the practice could offer. He knew nevertheless that those who remained were more likely to be peak and more than justify his investment.

Every morning in Dr Tagawa’s practice as part of our commitment to the team, we would meet 10 minutes prior to the start of the day to prepare for the show. The head receptionist had a simple but effective system for updating us with vital information, including how many patients we would be seeing, special recognitions (like patients’ birthdays), identifying difficult patients, where staff were expected to be (from the rota) and anyone off that day. It only took 5 minutes for the update and 5 minutes more to review the day before regarding what had worked well and what had not. It helped us to focus on the day ahead.

Consistency is critical to creating the ultimate team, it fosters credibility and trust. Ken Blanchard and Sheldon Bowles wrote in their book Raving Fans, “customers allow themselves to be seduced into becoming raving fans only when they know they can count on you time and time again.” This is also true for teams; just replace the word “customers” with “team members.” I often hear people say things like “one day we’re instructed to something and the next day it becomes something else.” If you want to be part of the ultimate team, be consistent.

It is said that what motivates individuals the most is recognition—a pat on the back or a word of praise here and there. It is all well done. Embrace this principle and, although it may feel awkward at first, if it is done often enough it becomes a habit. Sam Walton, founder of Wal-Mart Stores, said: “Appreciate everything your associates do for the business. Nothing else can quite substitute for a few well-chosen, well-timed, sincere words of praise. They’re absolutely free and worth a fortune.”

Building the ultimate team does not represent a challenge, but once achieved it is hugely rewarding. There is no point implementing one principle in isolation. It is like baking a cake without the eggs.

“Successful leaders embrace the power of teamwork by tapping into the innate strengths each person brings to the table.”

Conservative smile design for the general dentist

By Dr Rami Chayah, Lebanon

Abstract

This article discusses the advantages of short-term anterior tooth alignment using the Inman Aligner system, particularly for general dentists. The article will give a brief description of the Inman Aligner appliance and its use in short-term orthodontics, and it will answer the three major questions the general dentist should ask himself or herself during the treatment planning process. In support of this treatment modality, three case scenarios general dentists see daily will be given as examples.

Introduction

General dentists face the daily challenge of performing instant veneers for patients with misaligned anterior teeth who refuse orthodontic treatment, many of whom regard fixed orthodontic treatment as too long a commitment for achieving their desired aesthetic results. In today’s fast-paced life, some patients are not prepared to wait or to go through long treatment. One of the greatest benefits of short-term anterior alignment is that many people who would refuse comprehensive orthodontic treatment may accept short-term removable alignment techniques such as the Inman Aligner system.

The Inman Aligner is a simple removable appliance, a modification of the removable spring retainer. It uses super-elastic coil springs to apply highly efficient light and consistent forces on both the labial and lingual surfaces of the anterior teeth (Figs. 1 & 4). The appliance is fabricated on a cast on which, based on a surgical model, the anterior teeth nemedication have been removed and reset in the ideal position in wax on the working cast. When the patient wears the appliance, the built-in forces generated by the spring coils will correct the misaligned anterior teeth (Fig. 3).

What distinguishes the Inman Aligner appliance from other short-term orthodontic systems such as Invisalign (Align Technology) and Six Month Smiles is its low cost, low risk and short learning curve for general practitioners. Only one appliance is used from the start to the end of the treatment. Sometimes, several cleargenerations may be used—select-rotate resistant canines. The system is well received by patients because it is fast and relatively cheap. It also accommodates today’s active lifestyle. Usually, most cases take from six to 16 weeks. Patients can take the appliance out during meals or work meetings.

As with any other treatment techniques, the Inman Aligner has its limitations. Hence, case selection is imperative, as the Inman Aligner is not suitable for posterior orthodontic treatment or Class II or III treatment. Only certain types of movements are possible and some patients will still need conventional orthodontic treatment or indirect restorations. Certain criteria should be met before treatment proceeds. At consultation, other orthodontic alternatives should be offered. The dentist must quote for the long-term retention maintenance.

Conclusion

Dentists need to consider three questions about treatment during the treatment planning process. The first question: can the patient’s teeth be prepared or end up with root canal therapy? The second question: can the patient’s teeth be pressed in her own words. Her comments demonstrate the necessity of aligning the teeth first.

Fig. 1: Inman Aligner appliance. —Fig. 2: Illustration of the Inman Aligner showing the appliance components. —Fig. 3: Inman Aligner appliance in the mouth. Case 1. —Fig. 4: Frontal view with the teeth in occlusion before treatment. —Fig. 5: Frontal view with slightly open bite showing the status of the teeth before treatment. —Fig. 6: Frontal view with the teeth in occlusion after alignment and bleaching. —Fig. 7: Close-up frontal view of the maxillary teeth after ABB. —Fig. 8: Right side view of the maxillary teeth before ABB. —Fig. 9: Right side view of the maxillary teeth after ABB. —Fig. 10: Left side view of the maxillary teeth before ABB. —Fig. 11: Left side view of the maxillary teeth after alignment and bleaching. —Fig. 12: Full face before treatment. —Fig. 13: Full face after treatment. —Fig. 14: Frontal view showing the patient’s natural smile before treatment. —Fig. 15: Frontal view showing the patient’s unnatural smile before treatment. —Fig. 16: Full face showing the patient’s natural smile after treatment. —Fig. 17: Full face showing the patient’s unnatural smile after treatment. —Fig. 18: Occlusal view showing the maxillary arch before treatment. —Fig. 19: Occlusal view showing the maxillary arch after treatment.
fixed without orthodontic treatment in a very short period. In order for the general dentist to answer this question, he or she should first establish whether the patient does not wish to pursue orthodontic treatment because of the time commitment and cost. Would he or she also refuse short-term anterior tooth alignment? Would the occlusion be improved even though a Class I molar or Class I canine relationship may not be achieved? Patients may prefer short-term alignment techniques because of the shorter treatment time and the lower cost.

Case 1

The first case presented is a good example of a scenario relevant to the question above. The patient was a young woman at college who presented at my office requesting a full smile makeover of 20 veneers, she desired a “Hollywood smile” as expressed in her own words. Her complaint was the retracted maxillary right and left central incisors, the incisal edge wear on the maxillary central incisors and mandibular anterior teeth, the poyness shape of the maxillary and mandibular canines, and the yellow colour of her teeth overall (Figs. 1–5). It could be argued that it would be highly unethical to prepare the sound enamel, transforming her ten maxillary teeth into stamps, for the rest of her life, especially at this young age. After long discussion and explanation of the disadvantages of the shortcut route of preparing her teeth for ceramic veneers, this option was excluded. Several other options were available and discussed with her, but because she wanted a smile enhancement in a short period of time, conventional fixed orthodontic treatment was also excluded. After checking her bite, it was observed that there was insufficient interocclusal space to shift the maxillary central incisors forwards without opening the bite. However, the patient accepted use of the Inman Aligner system owing to its flexibility in that the wearer is able to remove the appliance after several hours a day and because of its short treatment time. The maxillary left central incisor would have been aggressively pre-prepared had it been treated restoratively (Figs. 6 & 7). By using a simple anterior alignment technique, the treatment took only eight weeks to straighten the teeth and a great deal of sound enamel tissue was preserved by conservatively resolving the unattractive appearance of the maxillary teeth (Figs. 8 & 9). Case 2

The second question to be considered regarding treatment: would some of the teeth be aggressively prepared or end up with root canal treatment if treated with restorative dentistry without alignment and would the overall outcome be better with alignment rather than without? This question addresses the ethical dilemma general dentists face every day. We often have cases with overlapping anterior central incisors in our office.

The patient presented in this case was bothered by the look of his overlapping maxillary central incisors (Figs. 20 & 21). His mandibular teeth were also crowded, but for some reason, his concern was only with his maxillary teeth. He had started to hide his smile in front of his friends, feeling embarrassed to show his maxillary teeth. After the full-orthodontic examination and discussion about all of the treatment options, including comprehensive orthodontic treatment, the patient chose the removable Inman Aligner system owing to its flexibility in that the wearer is able to remove the appliance after several hours a day and because of its short treatment time. The maxillary left central incisor would have been aggressively prepared had it been treated restoratively (Figs. 6 & 7). By using a simple anterior alignment technique, the treatment took only eight weeks to straighten the teeth and a great deal of sound enamel tissue was preserved by conservatively resolving the unattractive appearance of the maxillary teeth (Figs. 22 & 23).

The treatment plan was to follow the ABPI protocol (alignment, bonding and bonding). This concept still constitutes a smile makeover but in a very conservative manner. Taking into consideration her age and her sound enamel tissue, this was agreed to be the most progressive means of carrying out her smile enhancement. First, her maxillary teeth were aligned using the Inman Aligner with an expander for nine weeks. Two extra-expander courses to general practitioners. He seeks to share his passion for photographic and video production and believes that through his personalised dental approach, he can demonstrate a more positive way of practising dentistry, helping other dentists to view the dental domain in a different way.

Case 2—Fig. 20. Frontal view showing the overlapping central incisors before treatment.—Fig. 21. Side view showing the overlapping central incisors before treatment.—Fig. 22. Frontal view showing the teeth after alignment.—Fig. 23. Side view showing the teeth after alignment.—Figs. 24 & 25. Side views showing the moderately crowded and worn teeth before treatment.

Case 3—Fig. 25. Occlusal view showing the tooth misalignment.—Fig. 26. Occlusal view showing the result of treatment.—Fig. 27. Maxillary teeth after alignment to assess the restorative work needed.—Fig. 28. Natural-looking full maxillary veneers owing to aligning the teeth first.

Case 3

The third question to be considered: will the teeth require restorative work anyway, even after alignment? The case presented serves to demonstrate the necessity of aligning the teeth even before placing ceramic veneers. The patient in this case exhibited moderate misalignment with major anterior edge wear due to occlusal trauma. In addition, the teeth were darkened through years of stains being absorbed through the worn dentine of the incisal edges (Fig. 25). The patient initially requested thin veneers to resolve his smile problem, but after mocking up the design directly in his mouth, he was discouraged from pursuing this option owing to the amount of tissue that would be lost. The aggressive preparation of the occlusal white (Fig. 27). At this point, a direct mock-up was done to show the patient the smile design that could be achieved with composite. He felt that the teeth were still flat and wanted a fuller smile. Because we had aligned the teeth, only minimal preparation was needed as evident from the wax-up and the decision was made to fabricate ceramic veneers instead (Fig. 28). This case shows that for complex situations and considering patients’ high aesthetic demands, pre-alignment is essential to produce minimally invasive veneers with minimal enamel loss. This clinical approach guarantees the strength of bonding to the enamel is much greater.

Conclusion

The goal of this article is to encourage general dentists to reflect on the importance of considering short-term tooth alignment alone or in conjunction with restorative dentistry when treating patients. Hopefully, these three questions and cases will prompt readers in thinking through the process of this treatment modality.
